

# **PH due to Left Heart Disease (Group 2) Diagnosis and Current Management**

**Ran Heo**

**Cardiology, Hanyang University College of Medicine**

## Agenda : PH-LHD

- Introduction
  - Definition, Epidemiology, Pathophysiology
- Clinical significance of PH in LHD
- Diagnosis
- Treatment principles

# Pulmonary hypertension associated with left heart disease (PH-LHD)

- Pulmonary Hypertension (PH) **mPAP >20 mmHg**
- Post-capillary PH **PAWP >15 mmHg**
  - IpcPH (isolated post-capillary PH) **PVR  $\leq$ 2 WU**
  - CpcPH (combined post- and pre-capillary PH) **PVR >2 WU**

cf) Group 1 PAH, pre-capillary PH

- mPAP >20 mmHg, **PAWP  $\leq$ 15 mmHg**, PVR >2 WU

# Pathophysiology of PH-LHD

## PULMONARY CIRCULATION

**Superimposed components:**

- Vasoconstriction
- NO availability ↓
- Desensitisation to NP-induced vasodilation
- Arteriolar remodeling
- Venous congestion
- Metabolic factors
- Inflammatory cells

**Pulmonary vascular disease (i.e. remodeling)**

**RIGHT HEART**

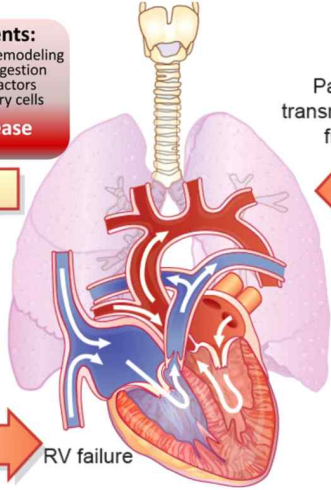

RV failure

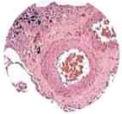

Passive backward transmission of left-sided filling pressures

**LEFT HEART**

Loss of LA compliance  
(exercise increased)  
Mitral regurgitation  
Systolic/diastolic LV dysfunction

Pulmonary arterial hypertension (PAH)	PH associated with left heart disease	PH associated with lung disease	PH associated with pulmonary artery obstructions	PH with unclear and/or multifactorial mechanisms
 <ul style="list-style-type: none"> <li>• Idiopathic/heritable</li> <li>• Associated conditions</li> </ul>	 <ul style="list-style-type: none"> <li>• lpcPH</li> <li>• CpcPH</li> </ul>	 <ul style="list-style-type: none"> <li>• Non-severe PH</li> <li>• Severe PH</li> </ul>	 <ul style="list-style-type: none"> <li>• CTEPH</li> <li>• Other pulmonary obstructions</li> </ul>	 <ul style="list-style-type: none"> <li>• Haematologic disorders</li> <li>• Systemic disorders</li> </ul>
<b>PREVALENCE</b>				
Rare	<b>65-80%</b>	Common	Rare	Rare
				

## Heart failure/cardiomyopathy

HFrEF

EF  $\leq$ 40%

HFmrEF

EF 41–49%

HFpEF

EF  $\geq$ 50%

## Valvular heart disease

Aortic valve

Stenosis/Regurgitation

Mitral valve

# Pulmonary vascular resistance and clinical outcomes in patients with pulmonary hypertension: a retrospective cohort study

Primary cohort: n=40082, US Veterans Affairs health-care system (2007.10–2016.9)

Validation cohort: n=3699, Vanderbilt University Medical Center (1998.9–2016.6)

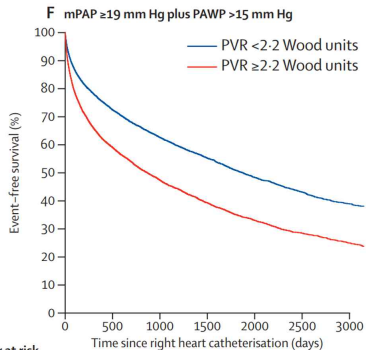

Median follow-up: p – 3.2 yrs (1153 days [IQR 570–1971]), v – 4.8 yrs (1752 days [IQR 1281–2999])

Hx. of HF 57.9%, COPD 33.3% (p)

## mPAP $\geq$ 19 mmHg and PVR of $\geq$ 2.2 WU

	All-cause mortality in the primary cohort (N=32 275)			Heart failure hospitalisation in the primary cohort (N=32 275)			Composite outcome in the primary cohort (N=32 275)			All-cause mortality in the validation cohort (N=2870)		
	Adjusted HR (95% CI)	$\chi^2$	p value	Adjusted HR (95% CI)	$\chi^2$	p value	Adjusted HR (95% CI)	$\chi^2$	p value	Adjusted HR (95% CI)	$\chi^2$	p value
All PAWP	1.47 (1.42–1.53)	379.6	<0.0001	1.17 (1.11–1.24)	32.7	<0.0001	1.37 (1.32–1.42)	308.4	p<0.0001	1.58 (1.31–1.91)	22.6	<0.0001
PAWP >15 mm Hg	1.36 (1.29–1.42)	163.7	<0.0001	1.15 (1.08–1.23)	19.7	<0.0001	1.27 (1.22–1.32)	123.7	p<0.0001	1.44 (1.12–1.83)	8.4	0.0037
PAWP $\leq$ 15 mm Hg	1.71 (1.59–1.84)	214.0	<0.0001	1.27 (1.13–1.43)	16.2	0.0001	1.62 (1.52–1.73)	202.5	p<0.0001	1.81 (1.33–2.47)	14.0	0.0002

## unadjusted mortality and HF hospitalization (primary cohort)

Number at risk (number censored)	0	500	1000	1500	2000	2500	3000
PVR $< 2.2$ Wood units	11 040 (0)	7495 (532)	4897 (2222)	3216 (3400)	1946 (4329)	1014 (5096)	380 (5657)

# PH-LHD

Patients: n=10023  
RHC from 2005.1-2012.9

Median follow-up: 4.3yrs (1.5-6.9)

**A** Survival in precapillary PH and PH-LHD

No. at risk						
No PH	3792	3176	2569	1608	908	252
Precapillary PH	1595	1088	768	416	194	56
PH-LHD	4603	2909	2059	1237	571	121

**B** Freedom from cardiac hospitalizations in precapillary PH and PH-LHD

No. at risk					
No PH	3807	2007	1225	637	253
Precapillary PH	1600	650	314	128	32
PH-LHD	4021	1390	674	301	87

**C** Survival in precapillary PH, PH-HFrEF, and PH-HFrEF

No. at risk						
No PH	3792	3176	2569	1608	908	252
Precapillary PH	1595	1088	768	416	194	56
PH-HFrEF	2577	1735	1226	740	356	79
PH-HFrEF	1813	1028	727	424	176	32

**D** Freedom from cardiac hospitalizations in precapillary PH, PH-HFrEF, and PH-HFrEF

No. at risk					
No PH	3807	2007	1225	637	253
Precapillary PH	1600	650	314	128	32
PH-HFrEF	2587	939	460	213	68
PH-HFrEF	1819	390	184	70	14

# Elevated TPG, PVR, DPG : Increased Mortality in PH-HFpEF

**A** Survival stratified by TPG of 12 mm Hg

No. at risk

TPG ≤ 12 mm Hg	1316	1033	943	883	701	570	455	325	225	127	49
TPG > 12 mm Hg	1261	936	792	699	525	408	285	198	131	73	30

**B** Survival stratified by PVR of 3 WU

No. at risk

PVR < 3 WU	1695	1340	1218	1129	894	710	563	396	272	153	58
PVR ≥ 3 WU	882	629	517	453	332	268	177	127	84	47	21

**C** Survival stratified by DPG of 7 mm Hg

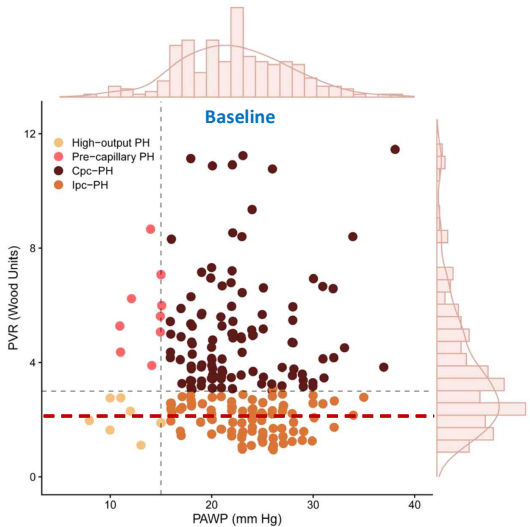

No. at risk

DPG < 7 mm Hg	2223	1725	1541	1411	1104	870	668	475	321	183	72
DPG ≥ 7 mm Hg	354	244	194	171	122	108	72	48	35	17	7

# Persistent PH in Corrected VHD

Patients: n=222  
PH and VHD successfully corrected at least 1 year before  
Median follow-up: 4.5 years

# Persistent PH in Corrected VHD

Compared with the Spanish age-matched population  
the standardized mortality ratio was 4.21 (95% CI, 3.43–5.17;  $P < 0.0001$ )

# Clinical significance of PH in HF

- RV is susceptible to pressure overload compared to LV
- PH : related with poor prognosis
- High PVR: consistent marker for poor prognosis

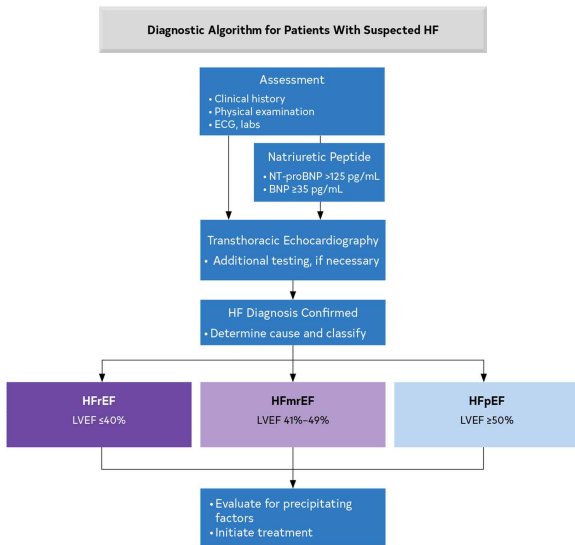

# Pathophysiology of PH-LHD

Variable degree of pulmonary congestion, vasoconstriction, vascular remodelling

# Diagnosis of PH-LHD

- Symptom: Non-specific
- Sign: Non-specific
- EKG
- Laboratory tests including BNP
- Echocardiography
- Right heart catheterization

# Diagnosis of PH-LHD

- Symptom: Non-specific

## Symptoms

- Dyspnoea on exertion (WHO-FC)
- Fatigue and rapid exhaustion
- Dyspnoea when bending forward (bendopnoea)
- Palpitations
- Haemoptysis
- Exercise-induced abdominal distension and nausea
- Weight gain due to fluid retention
- Syncope (during or shortly after physical exertion)

### Rare symptoms due to pulmonary artery dilation<sup>a</sup>

- Exertional chest pain:  
dynamic compression of the left main coronary artery
- Hoarseness (dysphonia):  
compression of the left laryngeal recurrent nerve  
(cardiovocal or Ortner's syndrome)
- Shortness of breath, wheezing, cough, lower respiratory tract infection, atelectasis:  
compression of the bronchi

# Diagnosis of PH-LHD

- Sign: Non-specific

# Diagnosis of PH-LHD

- ECG: Right axis deviation, P pulmonale, RV strain , RBBB

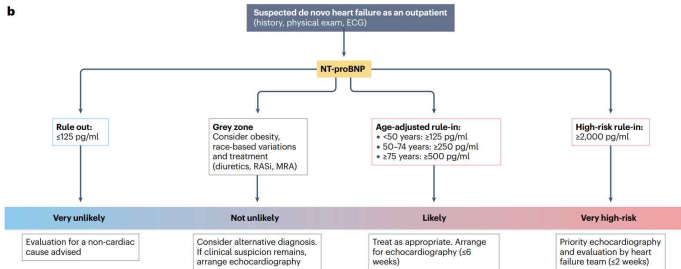

# Diagnosis of PH-LHD

- Laboratory tests
  - CBC, UA, electrolytes, BUN, Creatinine, glucose, lipid profile, LFT, iron studies, TSH
  - BNP/NT-proBNP

**Table 6. Selected Potential Causes of Elevated Natriuretic Peptide Levels<sup>50-53</sup>**

Cardiac
HF, including RV HF syndromes
ACS
Heart muscle disease, including LVH
VHD
Pericardial disease
AF
Myocarditis
Cardiac surgery
Cardioversion
Toxic-metabolic myocardial insults, including cancer chemotherapy
Noncardiac
Advancing age
Anemia
Renal failure
Pulmonary: Obstructive sleep apnea, severe pneumonia
Pulmonary embolism, pulmonary arterial hypertension
Critical illness
Bacterial sepsis
Severe burns

# Diagnosis of PH-LHD : Echocardiography

- Left heart disease (LHD)
  - Chamber size and systolic function
  - LV diastolic function
  - Cardiomyopathy
- Valvular Heart Disease (VHD)
- Pulmonary hypertension : TR maximal velocity
- Rt. heart assessment : RA, RV, function

# Diagnosis of PH-LHD : Echocardiography

- Left heart disease (LHD)
  - Chamber size
  - LV EF: HFrEF, HFmrEF, HFpEF
  - LV strain: peak GLS > 20% in healthy person
  - LV diastolic function
- Cardiomyopathy

# Diagnosis of PH-LHD : Echocardiography

- LHD - LV diastolic function
  - E, A, e', pulmonary vein flow
  - LA volume index
  - LA strain
  - LVH
  - PH - peak TR velocity

**Table 6** Mitral annular e' velocity values for diagnosis of impaired LV relaxation

	20-39 y	40-65 y	>65 y
1. Septal e', cm/s	<7	<6	<6
2. Lateral e', cm/s	<10	<8	<7
3. Average e', cm/s	<9	<7	<6.5

## LV Diastolic Function Grading & LAP Estimation

- Reduced e' velocity: septal  $\leq 6$  or lateral  $\leq 7$  or average  $\leq 6.5$  cm/s \*
- Increased E/e': septal  $\geq 15$  or lateral  $\geq 13$  or average  $\geq 14$
- Increased TR velocity  $\geq 2.8$  m/s or PASP  $\geq 35$  mm Hg

Except in  
MAC, MR, MS<sup>a</sup>  
Atrial Fibrillation  
LVAD  
Non-cardiac PH  
HTX  
Pericardial  
constriction

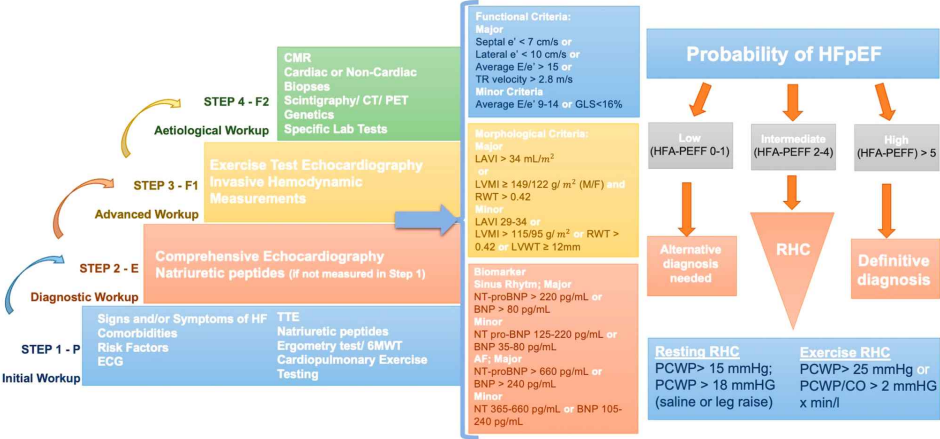

# Diagnosis of PH-LHD : Echocardiography

- Valvular heart disease (VHD)
- Pulmonary hypertension
  - Elevated sPAP
  - Rt. heart assessment

# Diagnosis of PH-LHD : HFpEF scores

- HFA-PEFF

# Diagnosis of PH-LHD : HFpEF scores

- H2FPEF

	Clinical Variable	Values	Points
<b>H<sub>2</sub></b>	<b>H</b> heavy	Body mass index > 30 kg/m <sup>2</sup>	2
	<b>H</b> ypertensive	2 or more antihypertensive medicines	1
<b>F</b>	Atrial <b>F</b> ibrillation	Paroxysmal or Persistent	3
<b>P</b>	<b>P</b> ulmonary Hypertension	Doppler Echocardiographic estimated Pulmonary Artery Systolic Pressure > 35 mmHg	1
<b>E</b>	<b>E</b> lder	Age > 60 years	1
<b>F</b>	<b>F</b> illing Pressure	Doppler Echocardiographic E/e' > 9	1
<b>H<sub>2</sub>FPEF score</b>			<b>Sum (0-9)</b>
Total Points	0 1 2 3 4 5 6 7 8 9		
	low (0-1) intermediate (2-5) high (6-9)		
Probability of HFpEF	0.2 0.3 0.4 0.5 0.6 0.7 0.8 0.9 0.95		

Feature	PH-LHD unlikely	Intermediate probability	PH-LHD likely
Age	<60 years	60–70 years	>70 years
Obesity, hypertension, dyslipidaemia, glucose intolerance/diabetes	No factors	1–2 factors	>2 factors
Presence of known LHD	No	Yes	Yes
Previous cardiac intervention	No	No	Yes
Atrial fibrillation	No	Paroxysmal	Permanent/persistent
Structural LHD	No	No	Present
ECG	Normal or signs of RV strain	Mild LVH	LBBB or LVH
Echocardiography	No LA dilation E/e' <13	No LA dilation Grade <2 mitral flow	LA dilation (LAVI >34 mL/m <sup>2</sup> ) LVH Grade >2 mitral flow
CPET	High VE/VCO <sub>2</sub> slope No EOv	Elevated VE/VCO <sub>2</sub> slope EOv	Mildly elevated VE/VCO <sub>2</sub> slope EOv
cMRI	No left-heart abnormalities		LVH LA dilation (strain or LA/RA >1)

# Diagnosis of PH-LHD

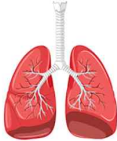

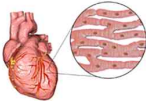

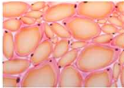

## Invasive assessment of hemodynamics - RHC

- Indications for RHC in LHD
  - Suspected PAH or CTEPH
  - Suspected CpcPH with a severe pre-capillary component, where further information will aid phenotyping and treatment decisions
  - Advanced HF and evaluation for heart transplantation
  - LHD with a high likelihood of PH-LHD and normal resting PAWP
    - Exercise testing and fluid challenge

## Treatment of PH-LHD

- The primary strategy
  - Treat the underlying cardiac disease
- Optimize GDMT
  - HFrEF: ARNI/ACEi (ARB), beta-blocker, MRA, SGLT2i
  - HFpEF: Tx. underlying disease, SGLT2i
- Correct structural lesions: MR, AS
- Manage comorbidities: HTN, AF, obesity (GLP1 receptor agonist)
- Diuretics : in the presence of fluid retention, ↓PAP and RV afterload

# Treatment of PH-LHD

		Pulmonary vasculature	Miocardium	Adipose tissue	Kidney
	<b>Mechanism of action</b>				
<b>SGLT2 inhibitors</b>	Reduce renal tubular glucose reabsorption, producing a reduction in blood glucose without stimulating insulin release	Reduce PA pressure and adverse remodelling	Reduce right ventricle systolic and diastolic pressures and adverse remodelling	Improve insulin sensitivity	Enhance diuresis
<b>GLP1 agonists</b>	Mimic the action of GLP-1	Reduce inflammation, fibrosis and adverse remodelling	Improve RV function, reduce inflammation, reduce adverse remodelling	Improve insulin sensitivity, weight loss and brown fat thermogenesis	
<b>ANRI</b>	Inhibit the RAAS and promotes the functioning of natriuretic peptides	Reduce PA pressure and adverse remodelling	Reduce RV pressure and adverse remodelling	Might improve insulin sensitivity	Enhance natriuresis and diuresis

## Treatment of PH-LHD

- ESC Guidelines recommendations on GLP-1 receptor agonist (GLP-1RA)
  - Overweight or obese patients with T2DM to reduce weight (Class IIa)
- GLP-1 RAs with proven CV benefit
  - liraglutide, semaglutide s.c., dulaglutide, efpeglenatide
  - recommended in T2DM and ASCVD to reduce CV events
  - independent of baseline or target HbA1c (Class I)
- GLP-1 RA semaglutide
  - in overweight (BMI  $>27$  kg/m<sup>2</sup>) or obese chronic coronary syndrome patients without diabetes to reduce CV mortality, MI, or stroke. (Class IIa)

# Treatment of PH-LHD

## Management of HFpEF

### Medical management

#### SGLT2i

- Contraindication of type 1 diabetes mellitus
- Precaution with mycotic genital infections

#### MRA

- Avoid with potassium  $\geq 5$  mmol/l, eGFR  $< 30$  ml/min/1.73 m<sup>2</sup> or serum creatinine  $\geq 2.5$  mg/dl

#### ARB/ARNI

- ARNI most beneficial with ejection fraction below normal
- ARB considered when ARNI contraindicated

### Non-pharmacological management

#### Exercise training

- Improvement in pVO<sub>2</sub>

#### Weight loss in obesity

### Comorbidity management

#### Diabetes mellitus

- Goal HbA1c 7–8%
- SGLT2i
- Metformin

#### Hypertension

- Goal BP  $< 130/80$  mmHg
- ACEi, ARB, MRA, ARNI

#### CKD

- Sacubitril-valsartan
- SGLT2i
- GLP1RA

#### Obesity

- Weight loss
- GLP1RA

#### CAD

- Revascularization for ischaemia

#### Atrial fibrillation

- Anti-coagulation
- Catheter ablation

#### Sleep apnoea

- Evaluation with polysomnography
- Unclear benefit to continuous positive pressure

#### Iron deficiency

- Consider iron repletion

#### COPD

- Smoking cessation
- O<sub>2</sub> therapy as needed

## Treatment of PH-LHD

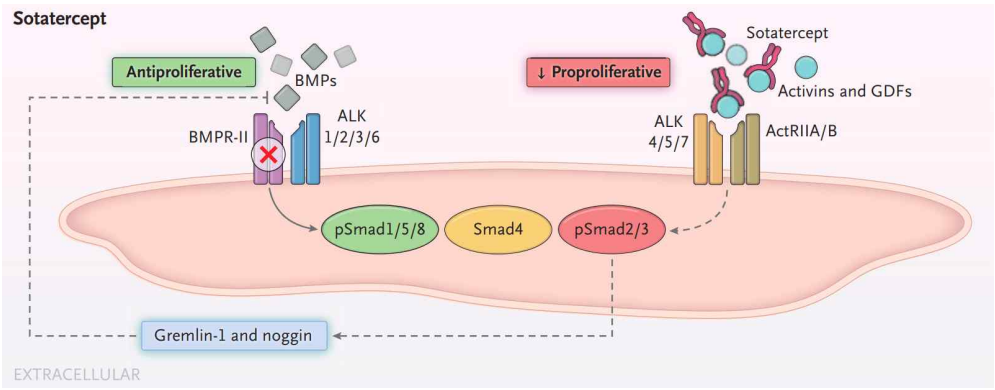

- PH contributes to RV dysfunction and HF symptoms
- PAH-targeted drugs tested (PDE5i, ERAs, prostacyclins)
- Key trials
  - RELAX (sildenafil in HFpEF): no benefit
  - PASSION (tadalafil in HFpEF + PH): early stop, no benefit
  - ENABLE (bosentan in HFrEF): no benefit, safety concerns
- Risks: systemic hypotension, pulmonary edema
- Current stance: Do not use PAH drugs in Group 2 PH

# Trials of PDE5 inhibitor in HF

Medication/device	Dose	Duration	Sample size	Inclusion	Primary endpoint	Results
PDE5i						
Sildenafil <sup>(32)</sup>	50 mg tid	24 weeks	44	HFpEF (LVEF $\geq$ 50%)	Pulmonary hemodynamics and RV performance in 1-year	Significant improvements in mPAP and RV function
Sildenafil (RELAX trial) <sup>(33)</sup>	20 mg tid	12 weeks	216	HFpEF (LVEF $\geq$ 50%)	Change in peak oxygen consumption after 24 weeks	No significant improvement
Sildenafil <sup>(34)</sup>	60 mg tid	12 weeks	52	HFpEF (LVEF $\geq$ 45%)	Change in mPAP after 12 weeks	No significant improvement
Sildenafil (SIOVAC trial) <sup>(35)</sup>	40 mg tid	6 months	200	Persistent PH after surgical correction of VHD	Composite clinical score	Worsening in clinical outcomes
Sildenafil <sup>(36)</sup>	100 mg daily	68 $\pm$ 58 days	6	HTPL candidates with CpcPH	PVR	Sildenafil lowers PVR in HTPL candidates with CpcPH
Sildenafil <sup>(37)</sup>	75 mg tid	12 to 15 weeks	58 (26 in sildenafil + LVAD; 32 in LVAD control)	Post-LVAD patients with persistent CpcPH	12 to 15 weeks change in PVR and dp/dtmax/IP	Significant decrease in PVR
Sildenafil <sup>(38)</sup>	140 mg/day	163 days	119	CpcPH patients with scheduled HTPL	mPAP, PVR, and TPG	Improved pulmonary hemodynamics with sildenafil + HTPL compared with HTPL without sildenafil

## Inconsistent results across trials

# Sotatercept

# Sotatercept for CpcPH (CADENCE study)

Design: Phase 2, RCT  
Patients: n=164

Baseline median

NTproBNP 1119 pg/mL

PVR 5.2 WU

mPAP 43 mmHg

PAWP 21 mmHg

Median follow-up: 24 weeks

**A** Change From Baseline to Week 24 in Pulmonary Vascular Resistance\*†

Hodges–Lehmann location shift from placebo estimate (95% CI), Wood units	Sotatercept 0.3 mg/kg	Sotatercept 0.7 mg/kg
	-1.02 (-1.81 to -0.23) P=0.004	-0.75 (-1.52 to 0.03) P=0.024

**B** Change From Baseline to Week 24 in Mean Pulmonary Arterial Pressure\*†

Hodges–Lehmann location shift from placebo estimate (95% CI), mm Hg	Sotatercept 0.3 mg/kg	Sotatercept 0.7 mg/kg
	-9.19 (-13.00 to -5.38)	-9.22 (-12.97 to -5.46)

**C** Change From Baseline to Week 24 in Pulmonary Arterial Wedge Pressure\*†

Hodges–Lehmann location shift from placebo estimate (95% CI), mm Hg	Sotatercept 0.3 mg/kg	Sotatercept 0.7 mg/kg
	-3.04 (-5.77 to -0.32)	-2.53 (-5.33 to 0.28)

**D** Change From Baseline to Week 24 in Transpulmonary Gradient\*†

Hodges–Lehmann location shift from placebo estimate (95% CI), mm Hg	Sotatercept 0.3 mg/kg	Sotatercept 0.7 mg/kg
	-6.49 (-9.72 to -3.27)	-7.25 (-10.38 to -4.12)

## Summary

- PH-LHD
  - PH-LHD is the most common form of PH
  - with or without pulmonary vascular remodeling : IpcPH, CpcPH
- Diagnosis: Comprehensive approach
- Treatment
  - GDMT and comorbidity treatment
  - PAH specific drug for PH-LHD: not proven, could be harmful
  - Further investigation with new therapeutic options i.e.) Sotatercept
